LifeOne Therapy of AIDS Patients

The immune healing substance LifeOne is a patented collection of herbs, mushrooms, nutrients, and selenium. It enters the body using liposomal technology, which permits a quicker uptake and prolonged circulation throughout the body.

LifeOne is able to kill viruses, which made it a logical substance to be tried in HIV infections. Four very ill HIV patients in Mexico were treated with one ounce of LifeOne three times daily. Their average fall in viral counts was 70% in 38 days. Lymphocyte counts increased significantly. Blood sugar values fell by an average of 14%. No side effects were seen on LifeOne therapy, and all subjects regained good health. This therapy is infinitely safer than highly active anti-retroviral drugs (HAARD), which can decrease viral replication and does not increase helper lymphocyte (CD4 T-lymphocytes) production.

However, there is incomplete recovery of killer lymphocytes (CD8 T-lymphocytes). As the CD4 lymphocytes are increasing, there is a proportionately larger drop in CD8 lymphocytes. The CD8 lymphocytes are critical because they induce CD4 lymphocytes to increase production of gamma interferon and FAS-ligand. These latter two molecules are critical

A Physician's Guide to Natural Health Products That Work 293

for long-term CD8 lymphocytes to function in a killer cell mode in HIV patients.

In HIV patients the LifeOne preparation increases lymphocyte numbers, increases CD4 and CD8 lymphocytes, while decreasing viral numbers by 70% in 42 days. HAARD patients may lose fat tissue in the extremities and gain fat tissue in the abdomen. They also experience a 60 to 80% increase in lipid values. Elevation of blood sugar values with large amounts of insulin secreted (insulin resistance) occurs in HAARD patients. Type 2 diabetes can appear and cardiovascular disease may also occur secondary to high triglycerides and VLDL fats.

HIV patients taking LifeOne are asked to follow a diet that restricts simple carbohydrates and sugar. This diet includes fresh vegetables, fish, poultry, lean meat, and fruit. Bread, white flour, corn, white potatoes, white rice, and most dairy products are avoided. LifeOne can be expected to restore HIV patients to good health.

The dosage of LifeOne for HIV should be one ounce three times daily for one month followed by one half ounce three times daily. After viral counts have become zero, LifeOne should be continued for another three months.

LifeOne can be obtained from the *Natural Health Team* (www.mynaturalhealthteam.com, 800-416-2806). It can also be ordered through www.lifeone.org.
